## EXTENSION OF FUNCTIONS ON BOOLEAN AIGEBRAS

BY

### 7. LIPECKI

Let A be a Boolean algebra with the operations of join, meet and difference denoted by  $\vee$ ,  $\wedge$  and  $\vee$ , respectively. The natural ordering of A is denoted by  $\leq$  and its minimal element by 0.

Given a subalgebra B of A and a function  $\mu$  on B with values in  $[0, \infty)$  or in an Abelian (topological) group G which has some properties related to the structures of both the domain and range spaces, we consider the problem of extending  $\mu$  to A all the properties preserved.

- J. Suppose  $\mu$ :  $B \rightarrow [0, \infty)$ . We are concerned with four sets of conditions imposed on  $\mu$ .
- (i)  $\mu$  is monotone (i.e.  $\mu(b) \leqslant \mu(c)$  whenever  $b, c \in B$  and  $b \leqslant c$ ), subadditive (i.e.  $\mu(b_1 \lor b_2) \leqslant \mu(b_1) + \mu(b_2)$  whenever  $b_1$ ,  $b_2 \in B$ ) and  $\mu(0) = 0$  (1).
- (ii)  $\mu$  is additive (i.e.  $\mu(b, v, b) = \mu(b, v, b) + \mu(b, whenever <math>b, b, c \in B$  and b, v, b = 0).
- (iii)  $\mu$  is monotone, subadditive and exhaustive (i.e.  $\mu(b_i) \rightarrow 0$  whenever  $\{b_i\} \subset B$  and  $b_i \wedge b_i = 0$  for all  $i \neq i'$ ).
- (iv)  $\mu$  is monotone, exhaustive and  $\mu(b \vee c) = \mu(b \vee c)$ (=  $\mu(b)$ ) whenever  $b, c \in B$  and  $\mu(c) = 0$ .

<sup>(&#</sup>x27;) Such a function is usually called a submeasure.

As easily seen,  $(ii)\Rightarrow(i)$  and  $(ii)\Rightarrow(iii)\Rightarrow(iv)$  and none of these implications can be reversed.

The case where  $\mu$  satisfies (i) is trivial. Putting  $\nu(a) = \inf \{\mu(b): a \le b \in B\}$  for  $a \in A$ , we get an extension satisfying (i).

The answer is also positive in case  $\mu$  fulfils (ii) or (iii). As for (ii), this is a classical result of Hahn-Banach type (see, e.g., [4], p. 270). When dealing with (iii), the transfinite argument must be essentially improved since the exhaustivity condition involves countably many elements of A. The improvement is suggested by the following observations:

- 1. For any  $\mu$  satisfying (i) the formula  $d_{\mu}(b_4, b_1) = \mu((b_4 \setminus b_1) \vee (b_1 \setminus b_4))$  for  $b_4$ ,  $b_4 \in B$  defines a pseudometric on B.
- 2. If  $C \subset B$  is a  $d_{\mu}$ -dense subalgebra of B and  $\mu \mid C$  is exhaustive, then so is  $\mu$ .

(The details can be reconstructed from [3]. For a different proof see [2].)

As for (iv), the answer is positive under the additional assumption that B has the following compactness type property investigated by Seever [5]:

(I) Suppose  $b_n$ ,  $c_n \in B$  and  $\bigvee_{i=1}^k b_i \le \bigvee_{i=1}^k c_i$  for k=1, 2, ...Then there exists  $x \in B$  with  $\bigvee_{i=1}^k b_i \le x \le \bigvee_{i=1}^k c_i$  for k=1, 2, ...

This property, which is somewhat weaker than  $\sigma$ -completeness, corresponds to the fact that the representation space of B is an F-space ([5], Theorem A). The author does not know whether the result fails for B without (I) (1). Before sketching

<sup>(&#</sup>x27;) For an arbitrary B it can be shown that if  $\mu$  fulfils (iv) with "exhaustive" weakened to " $\mu$ (0) = 0", then it extends to A all its properties preserved.

the proof we give a lemma which is a slight generalization of a result due to Seever ([5], Lemma 3.3).

Lemma. If B has the property (I), N is an ideal in B and B/N satisfies the countable chain condition (CCC), then B/N is complete.

Suppose  $\mu$  satisfies (iv) and B has the property (I). Put  $N = \{b \in B: \mu(b) = 0\}$ . Then B/N satisfies CCC, so that, by the Lemma and Sikorski's theorem ([6], 33.1), the quotient homomorphism  $B \rightarrow B/N$  extends to a homomorphism  $h: A \rightarrow B/N$ . Putting  $\nu(a) = \overline{\mu}(h(a))$ , where  $\overline{\mu}: B/N \rightarrow [0, \infty)$  is the quotient of  $\mu$ , we get the desired extension (cf. also [2]. Theorem 1).

II. Suppose G is an Abelian complete Hausdorff topological group and  $\mu$ : B-G is additive and exhaustive. (These properties are defined in just the same way as in I.) Then  $\mu$  extends to A both properties preserved ([3], Theorem 3, and [2], Corollary 3). This theorem can be proved using a similar idea to that described when dealing with  $\mu$  satisfying (iii). In fact, it is not hard to see that the group-valued case is more general than (iii). Let us also note that the assumption that G is complete cannot be dropped ([3], Example 4).

III. Suppose G is an Abelian group and  $\mu$ : B  $\rightarrow$  G is additive. In this case the extension problem is open ingeneral (e.g. for G being the additive group of integers). The answer is positive under each of the following additional assumptions:

- (a) (W. Herer) G is injective (see [1], §21, for definition).
  - (b) (C. Ryll-Nardzewski) card A ≤ K.
- (c) B/N is complete, where  $N = \{b \in B: \mu(c) = 0 \text{ for all } b \ge c \in B\}$ .

As for (c), the assertion follows by an application of Si-korski's theorem analogously to the case where  $\mu$  satisfies (iv).
